

Recruiter Quick Search — Product Requirements Document

Version 3.0 | July 24, 2026 | Status: Live (Vercel)

1. Product Summary

Recruiter Quick Search is a Chrome extension that lets recruiters verify any company without leaving the resume. Highlight a company name on any webpage — LinkedIn, a PDF resume, an Excel sheet, a job board — press `Ctrl+Shift+Y`, and a popup appears with an instant summary and eight structured facts about the company. No new tabs, no Googling, no context-switching.

One flow, three seconds: Highlight → shortcut → read → dismiss.

2. Problem Statement

Context

A candidate's past employer is one of the strongest signals on a resume — but only if the recruiter can evaluate it. During high-volume screening, recruiters constantly encounter unfamiliar company names and must decide, in seconds, whether that employer makes the candidate relevant, credible, and well-matched to the open role.

The Problem

Verifying an unfamiliar company means a six-step detour: highlight the name, right-click to search, wait for a new tab, scan multiple results, mentally stitch a summary from snippets, then navigate back to the resume. Each detour costs 15–30 seconds and breaks screening flow.

Impact

Metric	Estimate
Resumes screened/day	50–100
Context switches/day	20–50
Time lost per lookup	15–30 seconds
Hidden cost	Unfamiliar companies skipped, strong candidates silently rejected, fabricated employers pass unchallenged

3. Target User

Primary user: Agency and in-house recruiters doing high-volume resume screening, with a focus on the Indian hiring market.

When screening a resume, the recruiter is doing three jobs at once, and every piece of company data serves at least one of them:

- **SELECT** — Confirm the employer makes the candidate's experience relevant and credible
 - **FILTER OUT** — Quickly disqualify candidates whose employer signals a domain, scale, or legitimacy mismatch
 - **RANK** — Prioritise profiles by how closely the employer's context matches the hiring context
-

4. Why the Recruiter Needs Each Data Point

Every field in the popup exists because it powers a concrete screening decision.

Field	Why the recruiter needs it	Decision
Summary	1–3 sentence description of what the company does — the go/no-go gate. If the company is a BPO and the role needs product engineering, the recruiter rejects in 3 seconds instead of 30.	SELECT, FILTER OUT
Industry	Fastest hard filter in screening. A fintech role drops non-fintech candidates immediately.	FILTER OUT, RANK
Size	Headcount calibrates title meaning. An "Engineering Manager" at a 10-person startup vs. a 10,000-person enterprise are different jobs.	SELECT, RANK
Founded	Legitimacy signal. A candidate claiming 6 years at a company founded 2 years ago is a red flag. Age signals early-stage scrappiness vs. mature operations.	FILTER OUT, SELECT
Funding	Stage proxy. Seed-stage = 0→1 work, Series-D = scaling processes, Bootstrapped = capital-efficient. Matching candidate stage to hiring company stage is a strong predictor of startup-hire success.	RANK, SELECT
Revenue	Makes impact claims falsifiable. "Managed a Rs.50 Cr portfolio" at a company with negligible revenue doesn't add up. Separates substantive businesses from shell companies.	SELECT, FILTER OUT
Clients	Validates scale-of-work claims and reveals B2B vs B2C exposure. Notable logos transfer credibility.	SELECT, RANK
Leadership	Known founders upgrade unknown companies. "Ex-Flipkart leader" reframes a no-name startup as a pedigree employer. Provides a reference backchannel.	SELECT, RANK
Headquarters	Reveals which market the candidate knows — India-market experience vs. global exposure. Supports location verification.	SELECT, RANK

Field	Why the recruiter needs it	Decision
Official Link	One click to the employer's website for deeper diligence on shortlist-worthy profiles.	SELECT
"Not found"	Absence of information is information. A company with no discoverable footprint is itself a screening signal. The tool never hallucinates.	FILTER OUT

5. How the Recruiter Uses It

Trigger

Highlight a company name anywhere → Press `ctrl+Shift+Y` (or click the toolbar icon)

The Popup

A floating card in the top-right corner shows: narrative summary, eight structured fields (Founded, Headquarters, Size, Revenue, Funding, Industry, Leadership, Clients), a link to the official website, and a green `cached` badge on repeat lookups. Fields that can't be verified show "Not found".

Dismissal

`Escape` , close button (×), or click anywhere outside the popup.

States & Errors

Situation	What the recruiter sees
No text highlighted	"Please highlight a company name first."
Searching	"Searching for 'CompanyName'..."
Company not found	"No information found for 'CompanyName'."

Situation	What the recruiter sees
Network issue	"Could not reach the backend. Check your connection."
Cached result	Same popup with green "cached" badge — instant

On Google Drive / restricted pages

Highlight + `Ctrl+C` (copy), then `Ctrl+Shift+Y`. The popup shows an orange tip explaining this workflow.

6. How It Works (Non-Technical)

1. Highlighted text is sent to a FastAPI backend on Vercel
 2. The backend queries the Tavily Search API and parses results into a summary + 8 structured data points
 3. The popup renders on the same page; round-trip is 1–3 seconds
 4. Repeat lookups hit an in-memory cache (last 10) and return instantly
-

7. Current Limitations

Issue	Impact	Status
Ambiguous company names	May blend data from similarly-named companies	Mitigated with exact-phrase matching
Obscure / very new companies	May return "No information found"	Acceptable; Serper fallback active
Vercel cold start	First lookup after idle takes 3–5s	Loading state shown

8. What's Planned Next

- **Serper (Google Search) fallback** when Tavily returns no results — reduces "Not found" rate
 - **Government startup database APIs** (Startup India, MCA registry) — authoritative legitimacy data for Indian companies
 - **Improved disambiguation** for shared/similar company names
 - **Copy-to-clipboard** on the popup — paste verified facts into ATS notes
 - **Dark mode** detection to match host page theme
-

9. Technical Summary

Component	Technology
Browser extension	Chrome Manifest V3, vanilla JS
Backend	FastAPI (Python), deployed on Vercel
Primary search	Tavily Search API (AI-powered answers)
Fallback search	Serper (Google Search)
Cache	In-memory LRU, last 10 lookups
Permissions	<code>activeTab</code> , <code>scripting</code> , <code>contextMenus</code> , <code>clipboardRead</code>
Trigger methods	<code>Ctrl+Shift+Y</code> , toolbar icon, right-click context menu
Response time	1–3 seconds
